

(a) Tensorial local-harmonic construction

$$W = M^{-1/2} H M^{-1/2} = R \operatorname{diag}(\Lambda_a) R^T$$

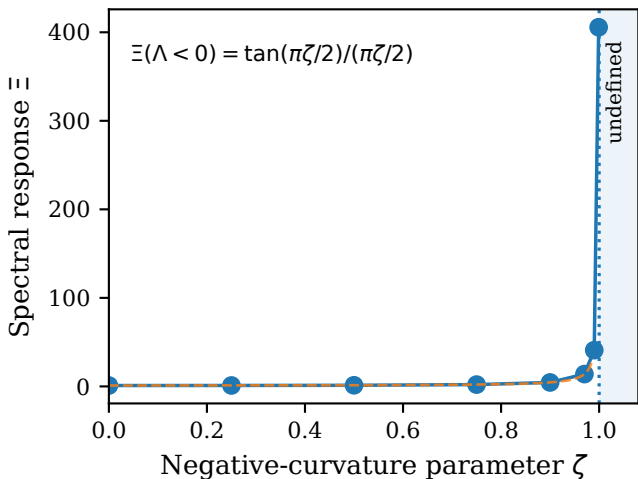

$$\Xi_\beta(W) = R \operatorname{diag}(\Xi_a) R^T$$

Quantum smearing follows the local mass-weighted normal modes and is generally tensorial.

(b) Rotated anisotropic harmonic oscillator

(c) Negative curvature approaches a caustic

(d) Gaussian existence criterion
